Submitted (23-JUL 1999) Genoscope - Centre National de Sequencage : BP 191 91006 EVRV cedex - FRANCE (E-mail : segref@genoscope.cns.fr - Web : www.genoscope.cns.fr)

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.degp.ebl.ac.uk - . This Drosophila melanomaster BAC ilibrary (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

//clone=library contains in the world population especially those inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate. Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumyanathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety. The library contains 36,864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents.

The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."

/note="Vector: pBeloBAC11; Site_1: HindIII; Site_2:
HindIII; Rice is one of two most popular grains in the world. Half of the world population especially those inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate. Monoctyledonous rice is a diploid plant (2n-24) with a haploid genome equivalent of 431 Mbp (Arumagnathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety. The library contains 36.864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents.
The deep coverage allows the isolation a particular sequence with a probability of 99.9 % Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.frutfiy.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswall Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2: no bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://Dacpac.med.buffalo.edu/drosophila_bac.htm.

Anote—Vector: lambda Unizap XR; Site_1: EcoR I; Site_2: Xho I; Lymphatic filarial nematode parasite of humans. The I: Lymphatic filarial nematode parasite of humans. The Surgia malay isolated from third stage infective larvae of infection and converted from mosquitoes 10 days after infection and converted to double stranded cDNA using reverse transcriptes and oilgo(di) followed by Rnase H and DNApol I: The library had 1.6 x 1086 independent recombinants and average insert size was 900 base pairs. The library was constructed by Wenhong Lu. The library is available from Dr. S.A. Williams, email genome@smith.edu.*

/lab_host="Organ: kidney: Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Plasmid DNA from the normalized library NCI_CGAP_Kid3 was prepared, and ss circles were made in vitro. Following HAP purlification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (clonelDs 1322376-1323911, 1456007-1456775, and 1500552-1502855). Subtraction by Bento Soares and M. Fatina Bonaldo.

Transplant rejection
Transplant rejection
Claim 10: Page 36; 41pp; English.
The present sequence is an immunomodulatory peptide, which
The present sequence is an immunomodulatory peptide, which
Comprises a Class I HIA-B alpha-1 domain sequence. It can be used
in a pharmaceutical composition together with a subtherapeutic dose
of an immunosuppressant, to extend the period of acceptance of a
transplant from a major histocompatibility complex (MHC) unmatched
donor, i.e. to inhibit transplant rejection. It can also be used in
the treatment of autoimmune diseases.
Peptides using the D-form amino acids are more effective
immunomodulators than their diastereomers or enantiomers.

R83061-R83085, R83090-R83096 and R82907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to abstinct the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                     HIA-B2702 CTL modulating peptide (B2702.84-75/75-84(T)). Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HIA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HIA-B2702 CTL modulating peptide (B2702.84-75/84-75). Cytotoxic I lymphocyte; CTL; major histocompatibility complex: MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R82907-R92914 represent fragments of
R83061-R83085, R83090-R83096 and R82907-R92914 represent fragments of
class I major histocompatibility complex (MHC) antigens. This sequent
is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Clayberger C, Krensky AM, Parham P;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R92207-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 98.086530/08.

New immunomodulating dimer peptide(s) - based on a class I HLA-B have immunomodulating dimer peptide(s) - based on a class I HLA-B have immunomodulating dimer pertide of transplants or treating autochmune diseases claim 16; Page 35; 41pp; English.

This sequence repersents a specifically claimed immunomodulating dimer peptide of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-771) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunomodulating dimer peptide #1.
Immunomodulating dimer; immunosuppressant drug; CTL activation;
transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;

Treating autoimmune diseases

I alpha 1 commune diseases

Claim 16; Page 35; 41pp; English.

This sequence represents a specifically claimed immunomodulating

This sequence represents a specifically claimed immunomodulating

Claim 16; Page 35; 41pp; English.

This sequence represents a specifically claimed immunomodulating

Claimed which has immunomodulating activity, including the N-terminal

acylated and/or C-terminal amidated or esterified forms of up to 60

amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-77b) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or N; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a

Nydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and as represents amino acid; The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid; sequences related to a class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cyctoxic

T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proteins of interest to activate CTLs. They can also inhibit and a class I man relection of I cells in response to anti-CD3. The peptide can be a class of the preventing artificancy and also inhibit the animal and antigenic or a compound and antigenic or for treating autoimmune and an animal and animal anim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
hydrophobic or small amino acid; aa82 - R or L; aa83 - G or R; and aa arepresents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-1 ymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenc peptides or proteins of interest to activate CLLs. They can also inhibit the used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rhematoid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           e.g. diabetes, rheumatoid arthritis and lupus erythematosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunomodulating dimer péptide #2.
Immunomodulating dimer; immunosuppressant drug; CTL activation;
transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   27-MVY-1997, U08689.

Treating autoimmune diseases

Example 1; Page 19; Alpp: English.

C-terminal amidated or exterrified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = C, F, English.

C-terminal amidated or exterrified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, and a represents amino acid; aa82 = R or L; aa83 = G or R; and as represents amino acid; aa82 = R or L; aa83 = G or R; and a represents amino acid sequences related to a Class I HiA-B alphal domain (positions at any peptide type bond within the brackets. They compounds comprise amino acid sequences related to a Class I HiA-B alphal domain (positions or 19-40). They can be used to inhibit the protiferation of T cells in a host to in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in a complexed can be used dor preventing rejection of response to anti-CD3. The peptide can be used for preventing rejection of characterial and inquise arythematosis. The products can also be considered to the products of the products can also be considered to the constant of the products can also be considered to the constant of the products can also be considered to the constant of the constant o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                            19-JUN-1998 (first entry)
Peptide B2702.04-75/75-84T tested for immunomodulating activity.
Immunomodulating dimer. immunosuppressant drug; CTL activation;
transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

R83061-R83085, R83096-R83096 and R92207-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLS) of the patient.
                                                                                                                                            HIA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84).
Cytotoxic I lymphocyte; CTL; major histocompatibility complex; MHC; immnosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HIA-B2702.

R83061-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-i domain of the class I MHC HAA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          therapy;

                                                                                                                                                                                                        claim 10; Page 36; 41pp; English.

The present sequence is an immunomodulatory peptide, which comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunomosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.

Peptides using the D-form amino acids are more effective immunomodulators than their diastereomers or enantiomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HLA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84(T)). a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCs), by sufficient to compete with p74 for the binding of the p74 ligand. New immunomodulating dimer peptide(s) - based on a Class I HLA-B alpha-I domain, used for preventing rejection of transplants or

Example 1: Page 19: 41pp; English.

Example 1: Page 19: 41pp; English.

Peptides Waish 4: 9 and Waish 7: 9 were assayed for their immunomodulating activity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or cutivity. A peptide-type compound comprises the formula; A-B, where A, B = (C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D. S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and aa represents amino cid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HiA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenc peptides or proteins of interest to activate CTLS. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, constructing and lupus erythematosis. The products can also be constructed to a class of the products can also be constructed. NAME OF THE PROPERTY OF THE PR

HESS H., HEID H., ZIMBELMANN R., FRANKE W.W.;
The protein complexity of the cytoskeleton of bovine and human sperm heads: the identification and characterization of cylicin II.*;
Exp. Cell Res. 218:174-182(1995).
-!- FUNCTION: POSSIBLE ARCHITECTURAL ROLE DURING SPERMATOGENESIS. MAY BE INVOLVED IN SPERMATID DIFFERENTIATION.
-!- SUBCELLULAR LOCATION: CALIX; SPERM HEAD CYTOSKELETAL STRUCTURE.
-!- TISSUE SPECIFICITY: TESTIS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Saccharomyces cerevisiae (Baker's yeast).

Submitted (MAY-1995) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: PUTATIVE ATP-DEPENDENT PROTEASE. NECESSARY FOR THE
ASSEMBLY OF MITOCHONDRIAL RESPIRATORY CHAIN AND ATPASE COMPLEXES.
FUNCTION BOTH IN POSTTARNSLATIONAL ASSEMBLY AND IN THE TURNOVER OF
MISTRANSLATED OR MISFOLDED POLYPEPTIDES.
-!-CORCIOR: BINDS ONE ZINC ION (POTENTIAL).
-!-SUBCELLULAR LOCATION: MITOCHONDRIAL.
-!-SIMILARITY: BELONGS TO THE AAA FAMILY OF ATPASES.
-!-SIMILARITY: BELONGS TO PEPTIDASE FAMILY M41 (ZINC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PFAM; PF01434; Peptidase_M41; 1.

-!- FUNCTION: SEQUENCE-SELECTIVE DNA-BINDING PROTEIN. COULD PLAY A IMPORTANT ROLE IN GENE REGULATION.

-!- SUBCELLULAR LOCATION: NUCLEAR.

-!- SUBCELLULAR LOCATION: 2 'CHROMO' DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

/note="Vector: pBACWICH; Site_1: His accompacte with
a haploid genome (or] of approximately 40 Mbp. Rice
blast is an important model fungal pathogen for studying
numerous aspects of the fungal-host interaction. In
order to facilitate genome wide enalysis, a BAC library
containing 9216 clones with an average insert size of 130
kbp was constructed. This library represents greater
than 25% genome coverage. High density colony filters
are available upon request."

Claim 10; Page 36; 41pp; English.

Claim 10; Page 36; 41pp; English.

The present sequence is an immunomodulatory peptide, which comprises a class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Example 14; Page 34; 80pp; English.

R83061-R83085, R83090-R831096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to a backen the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 14; Page 34; 80pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 14; Page 34; 80pp; English.

R83061-R83085, R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HLA-B2702 CTL modulating peptide (B2702.75-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                        Mew peptide(s) based on class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets claim 11; page 54; flpp: English.

The peptide is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition. This peptide sequence is more commonly found within larger peptide compounds of not more than 30 amino acids in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Extension of acceptance period of transplants from MHC unmatched donor hosts – using Class I B75-84 MHC antigen of the recipient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Comparising lympholid surface membrane proteins - which may comparising lympholid surface membrane of CTLs.

Example; Page 11; 29pp; English.

PS Example; Page 11; 29pp; English.

R95413-R95431 represent palindromes and fragments of R95413-R95431 represents the protein of R95413-R95431 represent palindromes and fragments of R95413-R95431 represents.

R95413-R95431 represent palindromes and fragments of S974 from a T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein HSC10. p74 is found in a limited number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide.

Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compositions comprising the mount of binding between the candidate compound and p74.

Modulation of CTL activity can be inhibited in a cellular composition containing the amount of binding between the candidate compound and p74.

Modulation of CTL activity can be inhibited and p74. in an amount sufficient to compete containing T-cells and antigen presenting cells (APCS), by adding to the compete containing the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         T-cell modulating peptide #2.

Example: Page 11: 29pp: English.

Example: Page 11: 29pp: English.

R95413, and R95415-R9543 represent palindromes and fragments of R95413, and R95415-R9543 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the HA-B2705:75-B4. These sequences can be used to isolate the protein proferm a T-cell lysate. P74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunojodically cross reactive with the heat shock protein H8-70. p74 is found in a limited number of cell types, but is particularly expressed on amphoteric detergent, and then passed through an affinity column containing a covalently bound HA-B2702 palindromic peptide.

C Compositions comprising the extracellular fragment of p74 combined with the extracellular fragment of p74 combined compositions can be screened for their effect on the cytolysis. Candidate compounds can be screened for their effect on the cytolysis.

C Compounds the amount of binding between the candidate compound and p74.

Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by adding to the containing the binding of the p74 ligand.
                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

New immunomodulating dimer peptide(s) - based on a Class I HLA-B alpha-1 domain, used for preventing rejection of transplants or treating autoimmune diseases.

Example 1; Page 19; 41pp; English.

Peptides W3738-98 and W33778-9 were assayed for their immunomodulating activity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-771) (aa79-84) or (aa80 = 1 or N; aa81, aa84= a hydrophobic or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            transplant rejection
Claim 10; Page 36; 41pp; English.
The present sequence is an immunomodulatory peptide, which
The present sequence is an immunomodulatory peptide, which
Comprises a class I HiAhB alpha-1 domain sequence. It can be used
in a pharmaceutical composition together with a subtherapeutic dose
of an immunosuppressant, to extend the period of acceptance of a
transplant from a major histocompatibility complex (MHC) unmatched
donor, i.e. to inhibit transplant rejection. It can also be used in
the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          19-JUN-1998 (first entry)
Peptide B2705.75-84 tested for immunomodulating activity.
Immunomodulating dimer; immunosuppressant drug; CTL activation; transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                          1. .10

W07512-W07518 represent T-cell modulating peptides that can be used in the w07512-W07518 represent T-cell modulating peptides that can be used in the w07512-W07518 represent T-cell mediated degreeces are based on a portion of the generic peptide corresponding to residues 70-91 of the alphal-domain of the major histocompatability complex (WHC) class I antigen (see W07510). The method is for affecting the course of an autoimmune disease involving T-cell mediated destruction of tissue in mammals. These peptides are used especially to treat insulin-dependent diabetes mellitus, preferably being administered during the pre-clinical stage to mellitus, preferably being administered during the pre-clinical stage to slogren's disease, thyroid disease, Hashimoto's thyroiditis, myasthenia gravis, etc. The peptides modulate T-cell mediated attack on autologous trarget cells, and may also reduce inflammation, swelling, and release of cytokines, perforins, granzymes etc. associated with T cell activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is an immunomodulatory peptide, which comprises a class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

treating autoimmune diseases

Example 1; Page 19; 41pp; English.

Peptides Wa3784-98 and Wa3778-9 were assayed for their immunomodulating cetivity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or crivity.

Cotivity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or crivity. A peptide-type compound comprises the formula A-B, where A, B = (Cotivity) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, Sor N; aa79 = R or C; aa80 = I or N; aand aa represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise at any peptide type bond within the brackets. The compounds comprise at any peptide type bond within the brackets. The compounds comprise at any peptide type bond within the brackets or Inverse to order at any peptide type act to inhibit cytoxic T-lymphocytes (CTL) from the activate CTLs. They can be used to inhibit the proliferation of Interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, response to arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
               acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLS. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, inhumanticid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 12-OCT-1995 (first entry)
Human [Phe74] HLA-B27-(62-85) antigen derived peptide.
Human [Phe74]-HLA-B27-(65-85) antigen derived peptide; cell receptor; interaction modulation; arthritis; neoplasias; lupus erythematosus.
                                                   Example 4; Page 45; 103pp; English. R71439-R71443 are human major histocompatibility complex class 1 (MHC 1) alpha 1 domain and HLA derived peptides and fusion peptides. They were used to modulate interactions between MHC 1/HLA and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment Sequence 17 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                              Gaps

A;Title: Organization, sequence and expression of the HLA-B27 gene: a molecular appro

A;Reference number: 807441; MUID:86138405

A;Reference number: 807441

A;Accession: 807441

A;Residues: 1-362 <WEI>
A;Accession: 807441

A;Residues: 1-362 <WEI>
A;Cross-references: EMBL: 803945

A;Note: the authors translated the codon GAC for residue 61 as Ala and the codon CAG

A;Note: this allele is designated B*27052 (formerly 27W)
